## Mid-Semester Test

Name : \_\_\_\_\_

Adm. No. : \_\_\_\_\_

Class : \_\_\_\_\_

Class S/N : \_\_\_\_\_

Date : \_\_\_\_\_

Time allowed : 1 hour

Maximum mark : 100

### Instructions

Answer all 4 questions. Take  $g = 9.80 \text{ m/s}^2$ .

This question paper consists of 3 printed pages including 1 page of formulae.

You are reminded that cheating during this test is a serious offence.

All working in support of your answer must be shown. Answers must be to appropriate significant figures.

- 
1. a) In the below equation, the SI units of  $x$  and  $x_0$  are in metres,  $t$  and  $t_0$  are in seconds,  $v_0$  is m/s and  $a$  is  $\text{m/s}^2$ . Using the dimensional analysis show whether the equation is homogenous or not.

$$x = x_0 + v_0(t - t_0) + \frac{1}{2}a(t - t_0)^2$$

- b) A particle is under a constant force  $\mathbf{F} = (-2\mathbf{i} + 4\mathbf{j} + \mathbf{k}) \text{ N}$  as it moves from a point (5, 1, 2) m to another point (-2, 3, 4) m. Find the work done on the particle.
- c) What is the angle between the displacement and force vectors in 1(b)?

(25 marks)

# SOLUTIONS

(a)  $LHS = x$

Therefore the dimension is  $[L]$

$$RHS = x_0 + v_0(t - t_0) + \frac{1}{2}a(t - t_0)^2$$

$$\begin{aligned} \text{The dimension in RHS is } [L] + [LT^{-1}][T] + [LT^{-2}][T^2] \\ = [L] + [L] + [L] = [L] = LHS \end{aligned}$$

Since it is a dimensionally consistent equation, it is homogenous.

(b) Displacement vector,  $\vec{s} = (-2\hat{i} + 3\hat{j} + 4\hat{k}) - (5\hat{i} + \hat{j} + 2\hat{k})$   
 $= (-7\hat{i} + 2\hat{j} + 2\hat{k})$

$$\begin{aligned} \text{Work done} = \vec{F} \odot \vec{s} &= (-2\hat{i} + 4\hat{j} + \hat{k}) \cdot (-7\hat{i} + 2\hat{j} + 2\hat{k}) \\ &= 14 + 8 + 2 = 24 \text{ J} \end{aligned}$$

(c)  $\vec{F} \odot \vec{s} = |\vec{F}||\vec{s}|\cos(\theta)$

$$\cos(\theta) = \frac{\vec{F} \cdot \vec{s}}{|\vec{F}||\vec{s}|} = \frac{24}{\sqrt{21}\sqrt{57}}$$

$$\theta = \cos^{-1}\left(\frac{24}{\sqrt{21}\sqrt{57}}\right) = 46^\circ$$

2. In the figure below, car A and car B, moves towards each other in adjacent lanes and parallel to an  $x$  axis. At time  $t = 0$ , car A is at  $x = -35.0$  m and accelerates uniformly from rest at  $2.00 \text{ m/s}^2$  while car B is at  $x = 270.0$  m moving at a constant speed of  $20.0 \text{ m/s}$ .

- When do the cars meet?
- Where do the cars meet?
- What is the speed of car A when it crosses car B?
- Sketch the displacement-time plots of the two cars on the same graph.

(25 marks)

## SOLUTIONS

- (a) Let " $t$ " be the time when the cars meet at a point " $x$ "

The equations for the cars would be

$$x_A = 270 - 20.0 \times t$$

$$x_B = -35 + \frac{1}{2}(2)t^2$$

Solving the above equations (with  $x_A = x_B$ ), we get  $t = 10.1$  s when the cars meet.

- (b) Substituting  $t$  in one of the above two equations we get  $x = 68$  m where the cars meet.

- (c)  $v = v_0 + at$   
 $= 0 + 2 \times 10.1$   
 $v = 20.2$  m/s

- (d)

3. The position vector of a particle of mass 2.0 kg moving on the  $x$ - $y$  plane is  $\vec{r} = 2t \hat{i} + 2 \sin(\pi t / 4) \hat{j}$ , with  $\vec{r}$  in metres and  $t$  in seconds. Calculate in component form the
- particle's average velocity during the first second of its journey.
  - particle's velocity at  $t = 1.0$  s.
  - force acting on the particle at  $t = 1.0$  s.

(25 marks)

# SOLUTIONS

- (a)  $\vec{r}(t) = 2t\hat{i} + 2\sin(\pi t/4)\hat{j}$   
 $\vec{r}(0.0) = 0\hat{i} + 0\hat{j}$   
 $\vec{r}(1.0) = 2\hat{i} + 2\sin(\pi/4)\hat{j}$   
 $\vec{v}_{\text{average}}(t) = \frac{\Delta\vec{r}}{\Delta t} = \frac{\{\vec{r}(1.0) - \vec{r}(0.0)\}}{1.0 - 0.0}$   
 $= \{2\hat{i} + 2\sin(\pi/4)\hat{j}\} \text{ m/s}$
- (b)  $\vec{v}(t) = 2\hat{i} + 2 \times \pi/4 \cos(\pi t/4)\hat{j}$   
 $= 2\hat{i} + \pi/2 \cos(\pi t/4)\hat{j}$   
 $\vec{v}(1.0) = 2\hat{i} + \pi/2 \cos(\pi/4)\hat{j}$   
 $= 2\hat{i} + \pi/2 \times \frac{1}{\sqrt{2}}\hat{j}$   
 $= 2\hat{i} + \frac{\pi}{2\sqrt{2}}\hat{j} \text{ m/s.}$
- (c)  $\vec{a}(t) = -2 \times (\pi/4)^2 \sin(\pi t/4)\hat{j}$   
 $\vec{a}(1.0) = -2 \times (\pi/4)^2 \times \frac{1}{\sqrt{2}}\hat{j} \text{ m/s}^2 = -0.87\hat{j} \text{ m/s}^2$   
Hence  $F = ma = -1.74\hat{j} \text{ N}$

4. The two blocks ( $A = 16 \text{ kg}$  and  $B = 88 \text{ kg}$ ) in the figure below are not attached to each other. The coefficient of static friction between the two blocks is  $\mu_s = 0.33$ , but the surface beneath the larger block is frictionless.

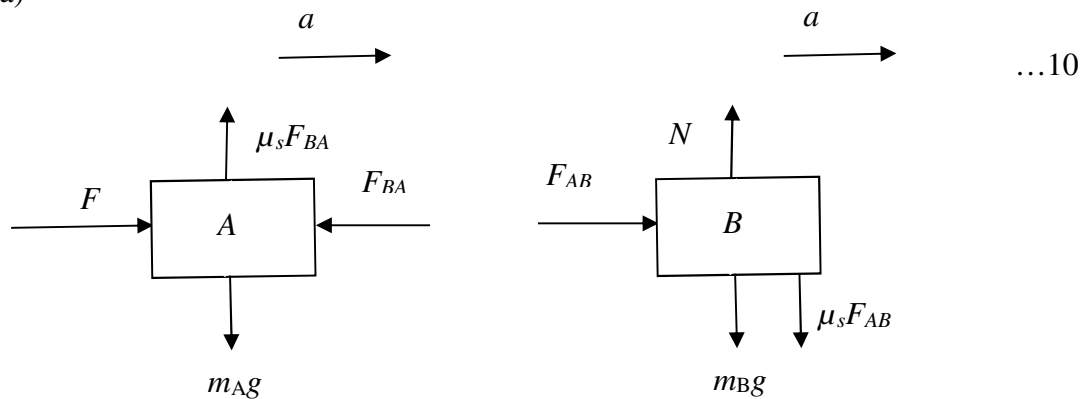

- a) Draw the free-body diagram for blocks  $A$  and  $B$  if a force  $F$  acts on  $A$  as shown in the figure.  
b) What is the magnitude of the minimum force  $F$  required to keep block  $A$  from slipping down block  $B$ ?  
c) If  $F$  acts on block  $B$  instead of block  $A$ , what is the magnitude of  $F$  so that block  $A$  does not fall off block  $B$ ?

(25 marks)

# SOLUTIONS

(a)

(b) For A not to fall off,  $\mu_s F_{BA} = m_A g$

$$\therefore F_{BA} = 16g / 0.33$$

Taking A and B accelerating as one object

$$F = (16 + 88)a = 104a$$

$$a = F / 104$$

Taking A accelerating alone

$$F - F_{BA} = 16a$$

$$F = F_{BA} + 16a$$

$$= \frac{16g}{0.33} + 16 \frac{F}{104}$$

$$F = 5.62 \times 10^2 \text{ N}$$

(c) If  $F$  acts on B, then

$$F - F_{AB} = 88a$$

$$F = F_{AB} + 88a$$

Since  $F_{AB} = F_{BA}$

$$F = \frac{16g}{0.33} + 88 \frac{F}{104}$$

$$F = 3.09 \times 10^3 \text{ N}$$
